

Chemical Filtration Guide - CAUTION!

This guide is not an approved list of chemicals. It is for reference only and may contain outdated or inaccurate information. It is to be used for supporting documentation to determine safe use of Air Science ductless fume hoods by your employer and chemical hygiene officer for your application.

This list is fully protected by copyright and no part of it may be reproduced in any forms or by any means – graphic, electronic, or mechanical including photocopying, recording, or taping – without the written permission of Air Science®. This resource is meant as a guide only. This guide is not an approved list of chemicals. Always refer to the most current edition of “Threshold Limit Values for Chemicals Substances and Physical Agents and Biological Exposure Indices” before using this chemical listing.*

Ductless fume hoods provide operator protection. Use of hazardous materials in these cabinets must be monitored by a qualified safety officer. Ductless fume hoods are not intended for use with explosive, flammable or radiological materials unless approved by a qualified chemical safety officer following risk evaluation ensuring that the chemical is safe to handle at all operating conditions. Variables in concentration, temperatures, phases and reactions with other chemicals contribute to uncertainty. You and your onsite chemical safety officer are responsible for determining the appropriate chemicals and quantities, ductless fume hoods and filters to ensure personnel safety. Thorough

analysis by your trained chemical safety officer must be performed for each application. Contact Air Science at info@airscience.com or 800.306.0656 for questions about individual applications.

DUCTLESS FUME HOODS WILL NOT PROTECT AGAINST ALL CHEMICALS IN THE WORKPLACE. YOU AND YOUR EMPLOYER MUST ESTABLISH A FORMAL CHEMICAL HYGIENE PROGRAM WHEN AIR SCIENCE DUCTLESS FUME HOODS ARE USED WITH HAZARDOUS CHEMICALS. THE PROGRAM SHOULD INCLUDE EDUCATION, TRAINING AND MAINTENANCE TO ENSURE THE SAFE AND PROPER APPLICATION, USE AND PERFORMANCE OF THE EQUIPMENT. APPROPRIATE PERSONAL PROTECTIVE CLOTHING, INCLUDING GLOVES AND EYEWEAR, ALONG WITH PROPER HANDLING OF CHEMICALS AND HAZARDOUS MATERIALS IN THE ENCLOSURE OR FUME HOOD ARE THE RESPONSIBILITY OF YOU AND YOUR EMPLOYER. AIR SCIENCE DUCTLESS FUME HOODS SHOULD ONLY BE USED BY PERSONNEL WHO HAVE FULLY REVIEWED THE EQUIPMENT OPERATING MANUAL AND UNDERSTAND ALL SPECIFIED LIMITATIONS AND WARNINGS. FAILURE TO FOLLOW THESE WARNINGS MAY RESULT IN ILLNESS OR DEATH.

This chemical list is developed as a guideline to assist in the safe use and operation of a ductless fume hood and is not an approved list of chemicals. This guide is designed as a reference to provide chemical specific data to aid in determining the suitability of ductless filtration for your application. It is intended to assist in the control of health hazards and should only be interpreted and applied by a person trained in an industrial hygiene discipline. It provides a philosophical and practical basis for the uses and limitations of carbon filters. This guide should only be used as supporting reference in the determination of the safe use of a chemical with a carbon-filtered Air Science ductless fume hood.

The data in this guide was gathered from the best available sources including information from carbon suppliers, results from in-house and external testing under dynamic conditions, theoretical extrapolation from available data and extensive engineering judgment. Actual values achieved will vary depending on environmental and operational conditions. All information is believed to be accurate as of printing date, however it may contain inaccurate or outdated information. Any exposure limits listed are for reference only. You should consult the latest regulatory limits applicable to your company, location or industry. We are not responsible for typographical errors. It is the responsibility of the user to contact us for the most current data. Additional data displayed in this guide was also provided from chemicals listed in the National Institute for Occupational Safety and Health (NIOSH) Pocket Guide to Chemical Hazards as well as the OSHA General Industry Air Contaminants Standard.

How to Use this Guide

Introduction

Air Science Ductless Fume Hoods are a viable alternative to conventional fume hoods that provide protection from toxic fumes to both laboratory personnel and the environment.

Unlike conventional fume hoods, these cabinets filter out chemical fumes and recycle air directly back to the laboratory, providing energy savings, personnel and environmental protection. As there is no need for complicated ducting systems, ductless fume hoods are more convenient and more mobile.

You might have concerns over which filters to choose for specific chemicals, as there are hundreds of different types of activated carbon in the world and each is made for different specific applications. Air Science has developed this Chemical Reference List to simplify the decision making process. This Chemical Reference List, combined with our Application Assessment Form, will ensure that you are using the right filter for your application.

How to use the Chemical Reference List

Step 1

Identify the chemicals most commonly used for your applications. The chemicals are listed in alphabetical order.

Step 2

For each chemical, follow the row across for:

- Substance Characteristics
- Recommended Filter Selection

Filter Configurations

Filters can be ordered in the following configurations:

Single	One type of activated carbon.
Blended	A single filter with two or more types of carbon blended throughout.
Layered	A single filter with two or more types of carbon in separate layers.
Stacked	Some units allow for two or more single filters each with a different type of carbon.

Definitions

- **ppm** – parts of vapor or gas per million parts of contaminated air by volume
- **mg/m³** – milligrams of substance per cubic meter of air
- **f/cc** – fibers per cubic centimeter fibers per cubic centimeter

Substance Characteristics Definitions

- **MW** – Molecular Weight
- **Bp** – Boiling Point
- **Mp** – Melting Point
- **SG** – Specific Gravity

Filter Recommendation System

- **x** – Suitable for the primary carbon filter if installed and monitored properly, according to manufacturer specifications.
- **NR** – Not suitable for ductless fume hood use. Call Air Science to discuss options for this type of chemical containment / protection.
- **Please call to discuss** – This application can be suitable in certain instances but needs a thorough review to ensure all safety precautions are followed.

Carbon Filtration Introduction

Fume hoods provide protection from fumes and vapors that are created by processes in the biotechnology, life sciences, forensic and pharmaceutical industries. Fume hoods can be ducted into an existing HVAC system or can be ductless.

Ductless filtration systems provide highly efficient, sustainable protection in portable, standalone equipment that can fit in nearly any laboratory. The purpose of this application guide is to provide information on the proper use of the ductless fume hood.

In addition to energy efficiency, capital investment savings and customizable filtration, ductless hoods can be designed for equivalent or safer performance than ducted hoods.

There are, however, limitations to ductless technology and possible safety consequences from the misuse of ductless fume hoods. It is important to know recommended guidelines for ductless fume hoods and appropriate carbon filtration.

Ductless vs. Ducted

Laboratory ventilation should be examined from an overall perspective to achieve the proper balance in terms of protection and cost. The table below summarizes the pros and cons of ducted versus ductless fume hoods.

Table 1 - Hood Type Comparison

Ductless Fume Hood	Conventional (Vented) Fume Hood
Handles limited quantity of chemicals	Handles unlimited chemical quantity
Handles limited types of chemicals	Handles larger number of chemicals
Proper filters need to be used	Does not utilize filters
Filters need to be closely monitored	Does not utilize filters
No installation cost or ductwork	Expensive installation and ductwork
Flexibility in location of fume hood, can be placed at point of actual use	Generally located on outside wall and difficult to move for relocation
No loss of conditioned air	Extensive make-up air required
Fumes captured within filter and oxidized or neutralized	Pollutants released to atmosphere in uncontrolled fashion

The conventional ducted fume hood is important for handling large quantities or difficult to handle chemicals. Ductless fume hoods, however, provide point of use protection at minimal costs without releasing dangerous toxins into the atmosphere. On the other hand, ductless fume hoods are limited in terms of the chemicals, and the quantities of those chemicals, they can handle.

Use of the Guide

The use of activated carbon filters in ductless mode is dependent on the chemicals being used and the quantity of chemical being evaporated into the filter. Generally speaking, chemicals with a molecular weight over 30 and a boiling point higher than 60°C (140°F) are candidates for adsorption with carbon filters. Yet there are exceptions and combinations which need to be evaluated by your supplier.

Carbon filters have pre-determined retention capacities. Your supplier should be able to predict the amount of chemical in grams or milliliters that is capable of being retained by the filter, prior to any measurable desorption taking place. This is done by using data from the carbon supplier, testing under dynamic conditions, extrapolation from available data and engineering judgement. The attached chemical listing is an example of how this can be done to provide the user with necessary information to ensure the safe use of a ductless fume hood equipped with activated carbon filters.

Note: When working with multiple chemicals and mixtures where the filter retention capacities are not additive, but conversely could significantly reduce filter retention capacity, a weighted average should be calculated. Typically, the chemical with the lowest molecular weight or lowest capacity would be released from the filter bed first.

Filtration Technology

The main principle on which the filtration of gas molecules is based is the concept of adsorption. Two main processes by which adsorption takes place are physical adsorption and chemisorption. Physical adsorption is non-specific; adsorption of the gas molecule is by diffusion (Brownian Movement) or adsorption/condensation using Van der Waal forces. The gas molecules move into an empty area and diffuse into the pore. Attracted and captured in the space by the Van der Waal force, the molecules penetrate into the pores, impact the walls and are trapped. The number of pores present in the carbon is vast and therefore the total surface area is extremely large.

The physical process of adsorption is followed by chemical adsorption (chemisorption). This is a chemical reaction in which the two substances react together and the resultant chemical is trapped on the filter material. The impregnation of filter media can greatly extend the range of gases that can be removed from the air. In all, over a dozen different filter impregnations are used on the filters included in our chemical listing (see Filter Summary table).

Factors That Affect Adsorption Efficiency

The ability of a filter to function efficiently is dependent on a number of factors including: temperature, humidity, residence time, age of filter, evaporation rate and concentration.

Temperature

The temperature of the gas is very important. The higher the temperature, the lower the adsorption capacity, especially for a gas with a low boiling point. As a general rule temperature must be kept below 40°C (104°F). **Never heat / boil in hood.**

Humidity

Relative humidity is also an important factor that can affect the efficiency of the filter. The molecules of gases with low boiling points will be less readily adsorbed because the molecules of the water vapor will be adsorbed in their place, leaving less free surface in the pores for the gas molecules to impact the carbon. As a general rule, the relative humidity must always be kept below 60%.

Residence Time

Residence time is the time needed by the air to cross the filter, during which it stays in contact with the carbon itself. This is the time during which the molecules of gas can be adsorbed by the pores of the carbon and should be as long as possible. To maximize residence time, the thickness of the filter must be sufficient and the air speed crossing it must be kept to a minimum. This minimum is influenced by the fact that the air speed across the front opening of the fume hood (face velocity) must be kept at a rate sufficient to insure containment of the fumes within the enclosure.

Filter Age, Evaporation Rate and Concentration

Carbon filters, if not properly stored before use, become less efficient with time. Additionally, the rate at which the chemical is being evaporated and the concentration of chemical vapors within the enclosure will likewise impact efficiency with the higher evaporation and concentration having a negative impact on efficiency.

Multiplex™ Filtration System

The Air Science Multiplex™ Filtration System consists of a pre-filter, main filter and optional safety filter to create a combination of chemical and physical architecture customized to each application. The mechanical design enhances safety, convenience and overall value. The electrostatic pre-filter is accessible from within the cabinet. A filter clamping mechanism allows for the filter to be easily installed and ensures an even seal at the filter peripheral face at all times to prevent bypass leakage.

The Air Science carbon filtration technique is based on enhanced, activated carbon particle formulations from specially selected, naturally occurring raw materials superior to wood or other organic sources. The carbon is treated to attain the proper porosity and aggregate surface area and to react with several ranges of aerosolized chemicals moved through the filter by an air handling blower. The multiplex option permits combining one or more filtration choices to meet a wider range of multiple-use applications.

Multiplexing permits configuration for the capture of acids, bases and particulates, such as biological aerosols when paired with HEPA or ULPA filters. The Air Science carbon filter is a self-contained assembly that is sized to fit the specified product model number. It is configured to optimize airflow across 100% of the filter surface area for maximum efficiency, prolonged filter life and optimal diffusion, saturation capacity and user safety. Air Science is the single source supplier for all pre-filters and carbon filters used in its products.

Filter Summary (other formulas may be available)

Formula	Description
GP Plus!	The most widely used filter in the range, primarily for solvent, organic and alcohol removal
ACI Plus!/SUL	Designed to neutralize volatile inorganic acid vapors
ACR	Iodine and methyl iodide vapors; It is frequently used for iodination reactions with lower level radioactive iodine
ACM	Mercury vapor
AMM	Removes vapors from dilute ammonia solutions and to remove low molecular weight amines
FOR	Designed to oxidize formaldehyde and glutaraldehyde fumes; It is widely used in hospital pathology laboratories
HEPA/UPLA	Powders and particulates

Multiplex Filtration System, Summary

	Filter Type	Filter Function
Standard Filters		
Pre-Filter	Electrostatic	Protects the main filter from aerosols, mists, dust and particulates. Pre-filter efficiency is typically 95.5% or greater down to 0.5 microns.
Main Filter	HEPA (ULPA optional)	A self-contained HEPA filter physically captures larger than 0.3 micron particulates. An ULPA filter may be specified to capture particulates larger than 0.12 microns. Specify when ordering.
Main Filter	Activated Carbon	FILTCO™ sourced, the carbon filters contain activated carbon granules chemically formulated to capture one or more specific vapors or family of vapors.
Safety Filters		
Safety Filter (HEPA/ULPA)	HEPA (ULPA optional)	The safety filter can be a self-contained HEPA filter which physically captures larger than 0.3 micron particulates. An ULPA filter may be specified to capture particulates larger than 0.12 microns. Specify when ordering. When chosen, the HEPA/ULPA safety filter permits the cabinet exhaust to be vented to the room without external ducting.
Safety Filter (Carbon)	Activated Carbon	FILTCO™ sourced, the single carbon filter contains activated carbon granules chemically formulated to capture one or more specific vapors or family of vapors. When chosen as the safety filter, the cabinet must be vented to the outside for USP 800 compliance.

Do's and Don'ts

The recommended filter types are intended as guidelines only and are subject to variations from a number of factors previously discussed. When using a number of different chemicals, the retention capacities are not additive but a weighted average needs to be calculated. Activated carbon filters are not recommended for use where very large quantities of contaminants or highly toxic substances are produced, such as in acid digestions or evaporation of solvents to dryness. The recommended filter is the main single-layer filter to be used for the application. In cases where more than one chemical family is involved it may be possible to use a multi-layered filter. All these cases should be discussed with your supplier to validate the choice of an appropriate filter. Always try to perform applications where the concentration levels are below the exposure limit of the chemicals being handled.

Minimize risk:

- Work with the smallest amounts of chemicals needed.
- Always work with concentrations below the maximum exposure limit.
- Minimize evaporation by keeping containers closed and sealed.
- Immediately clean up spills with absorbent wipes or towels and dispose of properly.
- Replace filters after accidental major spill or release.

Revolving Filters

Air Science strongly discourages the unsafe practice of revolving secondary back-up filters into the primary filter compartment. All Air Science units are designed to avoid this false sense of security. In a revolving filter system, users are instructed to rotate the secondary back-up filter into the primary filter position after non-permissible exposure levels of chemicals are detected within the monitoring chamber. Depending on when the unit can be properly shut down, the secondary filter can be loaded to the point of saturation itself, thereby creating a safety hazard if the filter is considered new. If a new spare filter is not immediately available, a user may inadvertently (or knowingly) re-install a contaminated primary filter into the secondary location permitting the system to operate without protection. Additionally, the secondary filter can become contaminated as it ages, sometimes for years, on top of an operational cabinet, losing filter efficiency by the time it is installed. Either practice puts both personnel and the environment at risk, even though some manufacturers provide stickers to label the filters as "used." Always know your filter type, suitable chemicals and installation date; generally speaking, change filters regularly as needed.

Filter Monitoring

There are two aspects to filter monitoring: checking the airflow to ensure the pre-filter is not clogged with dust and checking the exhaust air for chemical contaminants to ensure the main filter has not reached the breakthrough point. The results of the filter monitoring should be recorded on a dated log sheet. Airflow can be measured with an anemometer using a propeller, hot wire, or vane anemometer.

Monitoring can be performed with gas detection tubes. Most units have test ports allowing the use of this equipment in a zone immediately above the main filter. Back-up filters prevent any contamination coming from the main filter from being recirculated into the work area. A detailed monitoring program is given in the operating manual provided with each unit. An optional electronic filter saturation alarm offers limited detection of low concentrations of hydrocarbon, some gases and organic acids.

Your senses may also be used to notice any odors or irritation resulting from chemicals in use. If any of the above conditions indicate a potential filter breakthrough, immediately replace the filters. Additionally, air exchanges within rooms where ductless fume hoods are located should meet or exceed the exhaust output of the hood. Failure to ensure this condition can lead to an accumulation of chemicals in the event of an unmanned filter breakthrough.

Safety Standards

Users of ductless fume hoods should acquaint themselves with the safety standards currently applicable within the United States or country of use.

Filter Monitoring

Refer to ANSI/AIHA Z9.5 with specific reference to section 4.12.4 dealing with activated carbon filters and ANSI/AIHA Z9.7 entitled "Recirculation of Air from Industrial Process and Exhaust Systems." These are available through the American Industrial Hygiene Association, 3141 Fairview Park Drive, Suite 777, Falls Church, VA 22042.

Fume Hood Performance Testing

Refer to ANSI/ASHRAE 110-1985 entitled "Method of Testing Performance of Laboratory Fume Hoods" Available from the American National Standards Institute Headquarters, 1899 L Street NW, 11th Floor, Washington, DC 20036.

Requirements for Ventilation Devices

Refer to Code of Federal Regulations, Title 29, Part 1910 entitled "Occupational Exposure to Hazardous Chemicals in Laboratories; Final Rule" OSHA. Available from the U.S. Government Publishing Office, 732 N. Capital Street NW, Washington, DC 20401.

*Exposure Limits to Chemical Substances

Refer to most current edition of "Threshold Limit Values for Chemical Substances and Physical Agents and Biological Exposure Indices" available from the American Conference of Governmental Industrial Hygienists, 3640 Park 42 Drive, Cincinnati, OH 45241.

CHEMICAL REFERENCE LIST		SUBSTANCE CHARACTERISTICS					RECOMMENDED FILTER TYPE

Xylene [1330-20-7]	1,3-Dimethylbenzene; meta-Xylene; m-Xylol	C ₈ H ₁₀	106	0.860	138		x						x	
Xylidine (mixed isomers) [1300-73-8]	Aminodimethylbenzene, Aminoxylene, Dimethylaminobenzene, Dimethylaniline, Xylidine isomers (e.g., 2,4-Dimethylaniline)	C ₂₈ H ₂₆ N ₆	121	0.980	213		x						x	
Yttrium [7440-65-5], metal and compounds, as Y	Yttrium metal	C ₃₀ H ₉₁ O ₁₄ Y ₅	89	4.470										x
Zinc chloride fume [7646-85-7]	Zinc dichloride fume	Cl ₂ Zn	136					x						
Zinc chromates [13530-65-9; 11103-86-9; 37300-23-5], as Cr			(Varies)											x
Zinc oxide [1314-13-2] Dust	Zinc peroxide	OZn	81	5.610										x
Zirconium [7440-67-7] and compounds, as Zr	Zirconium metal: Zirconium	C ₈ H ₂₀ O ₄ Zr	91	6.510										x
